

OPERATION:

1. With 12V applied no power is being consumed.
2. Press the momentary switch and the 4300 energizes the 12VDC relay.
3. The relay's first set of contacts hold power on the 4300 timer for the time interval set with the resistor
4. The other set of relay contacts energize the 423 flasher which flashes the LED lamps until the 4300 times out.
5. The 4300 times out, turns the relay off which de-energizes everything.
